(a) unit cube, hemispherical seed

(b) mid-section $y=0.5$: boundary and initial conditions

initial: $\phi=0.9$ in the seed ($r<0.25$, smooth edge 0.03), 10^{-4} outside;

$c=0.1$ (= c_{stop}) inside, composition from the calibrated Day-1 state

$z=0$ (substrate): $\mathbf{u}=\mathbf{0}$; no flux of ϕ, c
